

Brainstorming & Idea Prioritization

Project: **Auto Ticket Classification using Flow Design**

Step 1: Team Gathering, Collaboration and Problem Selection

- **Problem to solve:** Support teams receive hundreds of tickets daily; manual reading, categorising and routing is slow, inconsistent and delays resolution.
- **Goal:** Automatically classify each incoming ticket (category, priority, team) and route it using a clear, visual flow design.
- **Team approach:** Each member writes ideas silently for 10 minutes, then the group clusters similar ideas and votes.

Step 2: Brainstorm, Idea Listing and Grouping

Group	Ideas
Input channels	Email, web form, chat and API tickets merged into one intake step
Classification	Keyword rules, ML text classifier, GenAI/LLM prompt-based classifier, hybrid (rules + ML)
Flow logic	Decision nodes for category, priority and sentiment; fallback branch for low confidence
Routing	Auto-assign to team or agent, round-robin, skill-based routing
Notifications	Auto-acknowledgement to customer, alert on urgent or SLA-risk tickets
Feedback loop	Agent corrects wrong label, corrections stored for retraining
Dashboard	Tickets by category, accuracy, average resolution time

Step 3: Idea Prioritization

Idea	Impact	Effort	Priority
Flow with decision nodes for category + priority	High	Low	Must have
ML text classifier for category	High	Medium	Must have
Auto-routing to the right team	High	Low	Must have
Low-confidence fallback to human review	High	Low	Must have
Auto-acknowledgement email	Medium	Low	Should have
Agent feedback loop / retraining	Medium	Medium	Should have
LLM-based classification and summary	High	High	Could have
Analytics dashboard	Medium	Medium	Could have
Multilingual ticket support	Medium	High	Later

Selected Idea

A flow-based auto-classification system: Ticket arrives → text is cleaned → classifier predicts category and priority → decision nodes route the ticket to the right team → low-confidence tickets go to manual review → agent corrections feed back to improve the model.
