

Define Problem Statement

Project: **Auto Ticket Classification using Flow Design**

Customer Problem Statement Template

Field	Description
I am	A customer support agent / support team lead
I'm trying to	Sort and route incoming support tickets quickly to the right team
But	Tickets are categorised manually, labels are inconsistent, and urgent issues get buried in the queue
Because	There is no automated, standard flow that reads the ticket and decides its category and priority
Which makes me feel	Overloaded, frustrated, and worried about missing SLAs

Problem Statements

PS	I am	I'm trying to	But	Because	Which makes me feel
PS-1	Support agent	Pick up tickets relevant to my skill	I spend time reading and re-assigning wrongly routed tickets	Routing is manual	Wasted time and stressed
PS-2	Support team lead	Meet SLA on urgent tickets	Urgent tickets are not identified early	Priority is set by guesswork	Anxious about escalations
PS-3	Customer	Get my issue resolved fast	My ticket bounces between teams	Wrong initial category	Frustrated and ignored

Reframed Problem Statement

How might we design an automated flow that reads each incoming ticket, classifies it by category and priority, and routes it to the right team with minimal human effort, while sending uncertain cases to manual review?
