

Empathy Map Canvas

Project: **Auto Ticket Classification using Flow Design**

Target User: Customer Support Agent / Team Lead

Quadrant	Observations
Says	"Too many tickets are in the wrong queue." "I can't tell which ones are urgent." "I need a faster way to sort these."
Thinks	Will an automated system make mistakes? Can I trust the labels? Will it reduce my workload or add more work?
Does	Reads every ticket manually, tags category, reassigns tickets, follows up on delayed cases, escalates urgent issues by chat or email
Feels	Overwhelmed by volume, pressure from SLAs, frustrated by repeated re-routing, relieved when tickets are handled quickly

Pains and Gains

Pains	Gains
Manual triage takes time Inconsistent labels between agents Urgent tickets missed Repeated re-assignment	Instant, consistent classification Urgent tickets highlighted first Right team gets the ticket the first time More time for actual problem-solving

Design Implication

- Show the flow clearly (input, classify, decide, route) so agents understand how a label was decided.
- Display a confidence score and let agents correct labels in one click.
- Send low-confidence tickets to manual review instead of guessing.
