

Solution Architecture

Project: Auto Ticket Classification using Flow Design

Solution Architecture Diagram

Architecture Description

- **Ticket Intake and Preprocessing:** collects tickets from all channels and prepares clean text.
- **Flow Engine:** controls the sequence of steps and makes routing decisions using the classifier's output and confidence.
- **ML Classifier:** predicts category and priority using a trained model kept in the model store.
- **Routing and Notifications:** assigns the ticket to a team and alerts them, especially for high priority.
- **Manual Review:** humans fix uncertain tickets; corrected labels return to the database for retraining.
- **Ticket Database:** single source of truth for tickets, labels, feedback and dashboard reports.
