

Problem-Solution Fit

Project: **Auto Ticket Classification using Flow Design**

Purpose

- Solve the problem of slow, inconsistent manual ticket triage by using an automated classification flow.
- Find the fit between the customer's problem and the solution, so support teams adopt it quickly.
- Understand the behaviour, triggers and channels that lead to ticket handling delays.

Problem-Solution Fit Canvas

Section	Description
1. Customer Segment(s)	Customer support agents, support team leads and helpdesk managers in IT, e-commerce and service companies handling high ticket volumes
2. Jobs-to-be-Done / Problems	Sort tickets by category and priority, route to the right team, meet SLA, avoid missed urgent issues
3. Triggers	Sudden rise in ticket volume, SLA breach, customer complaints about delays, manager reports on wrong routing
4. Emotions: Before / After	Before: overwhelmed, stressed, frustrated. After: in control, confident, relieved
5. Available Solutions	Manual tagging, static keyword rules, email filters. Limits: inflexible, error-prone, no learning
6. Customer Constraints	Limited budget, existing ticketing tools, need for human oversight, data privacy concerns
7. Behaviour	Agents read each ticket, reassign wrongly routed ones, ask colleagues, escalate urgent cases by chat or email
8. Channels of Behaviour (Online)	Ticketing portals, email, chat tools, team messaging apps
9. Channels of Behaviour (Offline)	Team huddles, verbal escalations, shift handover notes
10. Your Solution	Flow-based system that preprocesses ticket text, predicts category and priority with an ML model, routes via decision nodes, and sends low-confidence tickets to manual review
11. Root Cause of Problem	No standard automated way to read and decide on tickets; labels depend on individual judgement
